ShopLedger v2 — Feature Upgrade Prompt for Google AI Studio

Paste this into the SAME app's chat box (do not start a new app). Attach nothing else.

Upgrade the existing ShopLedger app with the features below. **Do NOT rebuild from scratch and do NOT change the existing design, colours, sidebar, screens or seed data.** Extend what exists. Keep all v1 hard rules: totals are calculated in code, and unconfirmed receipts never count in totals, Insights or answers.

Feature 1 — Language selection at login (NEW, do first)

- After OTP login succeeds, show a full-screen "Choose your language / अपनी भाषा चुनें" step BEFORE the app opens. Big tappable cards, each language written in its own script: English, हिंदी (Hindi), Hinglish, मराठी (Marathi), ગુજરાતી (Gujarati), বাংলা (Bengali), தமிழ் (Tamil), తెలుగు (Telugu), ಕನ್ನಡ (Kannada), മലയാളം (Malayalam), ਪੰਜਾਬੀ (Punjabi).
- Save the choice (localStorage) and use it everywhere: sidebar labels, buttons, headings and the chatbot switch to the selected language. Build a translations dictionary for all main UI strings for at least English, Hindi and Hinglish fully; other languages can start with the main labels (nav, buttons, headings) translated.
- Add a language switcher in the sidebar bottom so the vendor can change it anytime without logging out.
- Store the matching speech code with each language (e.g. Hindi = hi-IN, English = en-IN, Marathi = mr-IN, Bengali = bn-IN, Tamil = ta-IN, Telugu = te-IN, Gujarati = gu-IN, Kannada = kn-IN, Malayalam = ml-IN, Punjabi = pa-IN) — the chatbot voice and video mode will use it.

Feature 2 — Scan-first home screen

- After language selection, the app must open DIRECTLY on a **Scan** screen (make it the default first screen, add it as the first sidebar item "Scan" above Upload).
- The Scan screen is camera-first: a large live camera preview (getUserMedia) filling most of the screen, with a frame guide overlay and one big violet button "Scan Bill". Also two smaller options under it: "Upload photo" and "Upload register page".
- On Scan: capture the photo, send it to Gemini vision for extraction (vendor, date, items with amounts, total, GSTIN if present, category suggestion, unclear fields list). NEVER guess a field that is not readable — return it as unclear.
- Also a floating round **Scan button (camera icon) fixed at the bottom-RIGHT of every screen** in the app. Tapping it from Records, Insights or anywhere opens the same scan view

as a popup sheet.

Feature 3 — Background auto-save to Records (as "Needs review")

- Scanning or uploading must work in the background: after a photo is taken/uploaded, show a small toast "Bill received — adding to Records..." and let the vendor keep using any other screen while extraction finishes.
- When extraction finishes, the receipt appears automatically in **Records with status "Needs review"**, the Review badge count goes up, and a toast says "1 bill added to Records — tap to review".
- IMPORTANT: auto-saved bills are NOT confirmed. They must not count in any total, Insight or chatbot answer until the vendor opens them in Review and presses Confirm & save (same rule as v1). In Review they open with the extracted details pre-filled and unclear fields highlighted amber, exactly like the existing Review screen.
- Duplicate rule still applies in code: same vendor + same total + same/unclear date ⇒ mark "Possible duplicate" instead of counting it twice, and say so in the toast.

Feature 4 — Register page upload (handwritten khata)

- In Upload and on the Scan screen, add the option "Upload register page".
- A register page is a photo of a handwritten shop register/khata page with MANY entries. Send it to Gemini with this job: read every row and return a LIST of records — for each row: name/person or vendor, item or note, amount, date if written (do not invent a date; use the page date or leave unclear).
- Show the result as a checklist: "We found 6 entries in this register page" with each extracted row ticked and editable. One button "Add all to Records" saves them all with status "Needs review" (source tag: Register). Rows whose amount or name is unreadable are flagged amber "please confirm" inside the same checklist — never silently dropped and never guessed.

Feature 5 — Chatbot (floating, bottom-LEFT)

- Add a round floating chat icon fixed at the **bottom-LEFT** corner of every screen. It opens a chat panel (about 360px wide) titled with the assistant name "Sahayak".
- The chatbot talks ONLY in the vendor's selected language (Feature 1) — text replies and, when the vendor taps the speaker icon on a reply, spoken aloud with speechSynthesis using the stored speech code. Also give the chat a mic button: the vendor can SPEAK his question (SpeechRecognition with the same language code) instead of typing.
- The chatbot answers from the vendor's CONFIRMED records only (same data and rules as Insights Q&A): totals by category/vendor, biggest expense, this month's spend. Every answer

cites the receipt IDs used ("Sources: R-0105"). If the answer needs an unreviewed bill, it says that bill is not counted yet and offers to open it in Review.

- It can also DO small actions when asked in chat: "show my duplicates", "open records", "scan a bill" — navigate to that screen or open the scan sheet. Keep answers short, one or two lines, shopkeeper-simple language. If it does not know, it must say so in the selected language — never invent numbers.

Feature 6 — Live Video Bill Session (like a video call with AI)

- Add a "Video scan" button on the Scan screen and inside the floating scan sheet: "Start video scan".
- This opens a full-screen video-call-style view: live camera fills the screen; top bar shows a red recording dot + "AI is watching — show your bills one by one"; bottom bar has End call, Mute, and Switch camera buttons, like a normal video call.
- While the session runs: capture one frame every 2 seconds and send it to Gemini vision. When a bill/register page is clearly visible in a frame, extract it (same extraction as Feature 2; a frame showing a register page gives multiple records, same as Feature 4). Announce each catch by voice in the selected language ("Ek bill mil gaya — Sharma General Store, ₹2,450 — Records me daal diya hai") and show a small card sliding in at the bottom of the video with vendor + amount + "Added to Records · Needs review".
- Do not add the same bill twice: keep a session list of caught bills (vendor+total) and skip repeats; show the running count in the top bar ("3 bills caught").
- The vendor can also TALK during the session (mic on): simple spoken commands in his language — "stop", "ye wala bill hai" — at minimum support stop/end and mute by voice.
- On End call: show a summary screen — "Video session complete: 3 bills added to Records (Needs review), 1 possible duplicate skipped" — with a button "Review them now" going to the Review queue.
- Technical note: build this with periodic frame capture + Gemini vision calls (NOT a custom streaming server). If the camera or mic permission is denied, show a friendly message in the selected language explaining how to allow it.

What must NOT change

- The 4 existing sections (Upload, Review, Records, Insights), their design, the seed data (R-0101…R-0108, ₹12,175 confirmed total), the status rules, the CSV export, and the v1 hard rules stay exactly as they are.
- New bills from scan/register/video enter ONLY as Needs review or Possible duplicate. Nothing becomes Confirmed without the vendor pressing Confirm & save in Review.

Build all 6 features now, in this order: 1 language, 2 scan-first + floating scan button, 3 background auto-save, 4 register upload, 5 chatbot, 6 video session. Then list what you added,

feature by feature.

Follow-up fix prompts (only if needed)

1. If it rebuilds the design: "You changed the existing design. Restore the v1 design exactly (sidebar, colours, 4 sections, seed data) and re-apply only the 6 new features on top of it."
2. If auto-saved bills enter totals: "Bug: bills added by scan/video are counting in totals before confirmation. Fix: only status = confirmed counts in Records total, Insights and chatbot answers. Needs-review bills count nowhere until confirmed."
3. If chatbot answers in English: "The chatbot must reply only in the vendor's selected language, including its error and 'not counted' messages. Fix all chatbot strings to use the selected language."
