ShopLedger — Master Prompt for Google AI Studio (Build)

Attach the 3 design screenshots with this prompt. Paste everything below the line.

Build a complete, working web app called **ShopLedger** — an expense-receipt manager for a small Indian shop owner. Match the attached screenshots as closely as possible: same layout, same screens, same colours, same sample data. This is version 1: a fully functional front-end with in-browser state. No backend, no database, no real SMS service yet.

Tech

- React + TypeScript + Tailwind CSS, single-page app.
- State in React, persisted to localStorage so data survives refresh.
- Font: Inter. Icons: simple dots / lucide-style, no emojis in the UI.

Design system (match screenshots)

- Light theme. App background #F6F7FB. Cards white, border-radius 16px, very subtle shadow, 1px light border.
- Primary colour: indigo-violet (#5945E0 approx). Primary buttons filled violet, white text, rounded 10px.
- Left sidebar 240px, white: logo = violet rounded square with white "S" + "ShopLedger" bold. Nav items with a small dot before the label; active item has light violet background (#EFEDFD) and violet bold text. A count badge (violet pill) sits at the right of "Review".
- Status pills: Confirmed = green bg (#E6F9EE) dark green text; Possible duplicate = red/pink bg (#FDECEC) dark red text; Needs review = amber bg (#FFF4D6) dark amber text.
- Money format: Indian style with ₹ and 2 decimals (e.g. ₹12,175.00). Amounts right-aligned in tables.

Screen 0 — Login (first screen, no landing/marketing page)

- Centred card: ShopLedger logo, "Login to your shop" heading.
- Two tabs: **Mobile number** | **Email**. One input + "Send OTP" button.
- On send: show a 6-box OTP input. This is a demo build: accept the code **123456** (and show a small hint "Demo code: 123456" under it so anyone testing can log in). Wrong code shows an error.

- "Verify & Login" → goes straight into the app (Upload screen).
- Under the card, small text link: "Prefer a password? Set one after login" (non-functional in v1, just show it).
- A Logout option in the sidebar bottom returns to this login screen.

App shell

Sidebar nav (exactly these 4): **Upload**, **Review** (badge = number of receipts needing review), **Records**, **Insights**. Clicking switches the main panel. Review badge updates live as receipts are confirmed.

Data model

Receipt = { id (e.g. "R-0101"), vendor, date ("03 Oct 2026"), category, items: [{name, amount}], total, status: "confirmed" | "needs_review" | "possible_duplicate", unclearFields: [field names], fileName }. Categories (exactly these 6): Utilities, Supplies & Stock, Marketing, Transport, Packaging, Office.

Seed data (use exactly this)

20 receipts in the story; show these 8:

1. R-0101, Sharma General Store, 03 Oct 2026, Supplies & Stock, confirmed, ₹2,450.00
2. R-0102, Gupta Electricals, 04 Oct 2026, Utilities, confirmed, ₹3,120.00
3. R-0103, Metro Stationers, 06 Oct 2026, Office, confirmed, ₹865.00
4. R-0104, Fresh Pack Co., 08 Oct 2026, Packaging, confirmed, ₹1,640.00
5. R-0105, Sunrise Fuel, 09 Oct 2026, Transport, confirmed, ₹1,800.00
6. R-0106, Print Hub, 11 Oct 2026, Marketing, confirmed, ₹2,300.00
7. R-0107, Sharma General Store, date unclear "2? Oct 2026", Supplies & Stock, possible_duplicate, ₹1,284.00. Items: Basmati Rice 5kg ₹540.00, Sunflower Oil 1L ₹189.00, Printer Paper A4 ₹395.00, Packing Tape x4 ₹160.00. unclearFields: ["date"]. It duplicates another Sharma General Store receipt with the same date and total.
8. R-0108, City Courier, 14 Oct 2026, Transport, needs_review, ₹410.00 Review header progress: "7 of 20 reviewed · 3 need attention" with a green progress bar at 35%.

Screen 1 — Upload

- Big drag-and-drop zone ("Drop receipt photos or PDFs, or click to browse"), file input accepting images and PDF.

- Uploaded files appear in a list with status "Queued". A "Process receipt" button per file: show a 1-second "Reading..." state, then the receipt moves to the Review queue with mock pre-filled extraction (vendor, date, items, total, category) so the full flow works end-to-end without a real AI call.
- Note under the zone: "Works with paper bills, WhatsApp forwards and UPI payment screenshots."

Screen 2 — Review (match screenshot 3)

- Header: "Review receipt", subtitle from progress ("7 of 20 reviewed · 3 need attention"), progress bar top-right.
- Two columns. LEFT card "Original receipt" (file name top-right): show the uploaded image, or if none, a sample paper-receipt card (shop name, address line, bill no, items, TOTAL) drawn in HTML. On it, highlight boxes: amber outline = unclear field, violet outline = field matched to the form. Legend under the card: "● Unclear field ● Matched to form".
- RIGHT card "Extracted details" with a small "AI extracted" chip:
  - Vendor and Date inputs side by side, each with a tiny "AI" chip. The Date input for R-0107 has an amber border, value "2?/10/2026", a "Review" chip, and under it in amber text: "Partly unreadable – please confirm".
  - Items table: ITEM | AMOUNT (₹), one row per item, amounts editable.
  - Total and Category inputs side by side with "AI" chips (Category is a dropdown of the 6 categories).
  - If the receipt is a possible duplicate: a red alert box "Possible duplicate — Matches R-0112: same vendor, date and total" with a "Compare" link that opens a modal showing the two receipts side by side.
  - Buttons: "Confirm & save" (primary violet), "Mark duplicate", "Skip".
- Confirm & save: status becomes confirmed, Review badge count decreases, totals everywhere recompute, and the next queued receipt loads. Mark duplicate: status stays possible_duplicate and it never counts in totals. Skip: moves to the next receipt without changing status.

Screen 3 — Records (match screenshot 2)

- Header "Records", subtitle with live counts: "6 confirmed · 1 duplicate to review · 1 needs review". Search box (filters by vendor or receipt id) + violet "Export CSV" button.
- Filter chips with live counts: All 8 · Confirmed 6 · Needs review 1 · Duplicates 1.
- Table columns: RECEIPT (id, violet), VENDOR, DATE, CATEGORY, STATUS (pill), TOTAL (₹) right-aligned.
- Footer bar: left "6 confirmed records", right bold "Confirmed total ₹12,175.00".

- Export CSV downloads a CSV of CONFIRMED records only. Columns: Date, Vendor, Category, Items, GSTIN, Total.

Screen 4 — Insights (match screenshot 1)

- Header "Insights", subtitle "Built only from confirmed records". Top-right: a pill "October 2026" and a "Download CSV" button (same CSV as Records).
- 4 stat cards: **Total spend ₹12,175** ("6 confirmed receipts"), **Average receipt ₹2,029** ("across 6 receipts"), **Top category: Utilities** ("₹3,120 · 25.6% of spend"), **Duplicates caught: 1** (red number; "R-0107 held for review").
- LEFT card "Spend by category" (note top-right: "Click a bar to see receipts"): horizontal bars sorted high to low with ₹ value and % — Utilities ₹3,120 · 25.6%, Supplies & Stock ₹2,450 · 20.1%, Marketing ₹2,300 · 18.9%, Transport ₹1,800 · 14.8%, Packaging ₹1,640 · 13.5%, Office ₹865 · 7.1%. Clicking a bar jumps to Records filtered to that category.
- RIGHT card "Ask your records": a chat. Preload this exact exchange — user: "How much did I spend on transport?" → assistant: "You spent ₹1,800.00 on Transport this month, from 1 confirmed receipt (Sunrise Fuel, 09 Oct). The R-0108 courier receipt is still unreviewed, so it is not counted." with "Sources: R-0105" under it as a chip. Input box "Ask about your spending..." + Send button.
- Q&A logic (rule-based in code, no external AI in v1): answer questions about total spend by category or vendor by summing CONFIRMED records only; always show the receipt IDs used as Sources; if matching records exist that are unreviewed or duplicates, add a line saying they were not counted. If nothing matches, reply: "That is not in your confirmed records."

Hard rules (this is the product's identity — do not break them)

1. ALL totals, averages, percentages and category sums are calculated in JavaScript from the records array. Never hardcode a total. Never let the AI/mock layer invent numbers.
2. Unconfirmed receipts (needs_review, possible_duplicate) NEVER count in Records totals, Insights, or Q&A answers.
3. Duplicate detection in code: same vendor + same total + same/unclear date ⇒ status possible_duplicate with the alert box.
4. Unclear fields are shown highlighted with a "please confirm" note — the app never silently guesses them.

NOT in v1 (do not build these)

No real SMS/OTP service, no backend or database, no real OCR/AI extraction (mock extraction only), no payments, no settings page, no landing page, no extra screens beyond Login + the 4 sections.

Generate the complete app in one go with all screens working and the seed data loaded, then list the files you created.

Follow-up fix prompts (use only if needed)

1. Layout fix: "The sidebar and cards do not match the screenshots. Sidebar must be 240px white with the violet 'S' logo, nav items with dots, active item light violet. Content cards white, 16px radius, on #F6F7FB background. Fix only the styling, do not change any logic or data."
2. Extra pages fix: "You added screens I did not ask for. Keep only: Login, Upload, Review, Records, Insights. Remove everything else and make the app open on Login."
3. Numbers fix: "Totals look hardcoded. Recalculate every total, average, percentage and the Confirmed total from the records array in code, counting confirmed receipts only. Show the calculation updates live when a receipt is confirmed in Review."
